AI Review

The code does not handle the case when the input list is empty, which will result in a `ZeroDivisionError`. It also uses a less Pythonic way to calculate the sum of the numbers.

Original Code

```
def calculate_average(numbers):  
    total = 0  
    for i in range(len(numbers)):  
        total += numbers[i]  
  
    average = total / len(numbers)  
    return average  
  
numbers = []  
result = calculate_average(numbers)  
print("Average:", result)
```

AI Corrected Code

```
def calculate_average(numbers):  
    if len(numbers) == 0:  
        return 0  
    return sum(numbers) / len(numbers)  
  
def main():  
    numbers = [1, 2, 3, 4, 5]  
    result = calculate_average(numbers)  
    print("Average:", result)  
  
if __name__ == "__main__":  
    main()
```
