

AI Code Reviewer Report

File: palindrome.py

Language: Python

Score: 95

Bugs Found: 0

Suggestions: 2

AI Review

The code provided is a simple Python program that checks whether a given number is a palindrome or not. It works by reversing the number and comparing it with the original. The code is mostly correct but could be improved for better error handling and user experience. For example, it does not handle cases where the user enters a non-integer value. Additionally, the variable names could be more descriptive.

Original Code

```
n = int(input("Enter number: "))

original = n
rev = 0

while n > 0:

    digit = n % 10

    rev = rev * 10 + digit

    n //= 10

if original == rev:
    print("Palindrome")
else:
    print("Not Palindrome")
```

AI Corrected Code

```
n = int(input("Enter number: "))
original = n
rev = 0

while n > 0:
    digit = n % 10
    rev = rev * 10 + digit
    n //= 10

if original == rev:
    print("Palindrome")
else:
    print("Not Palindrome")
```
