AI Review

The code provided is a simple C program to check whether a given number is prime or not. It takes an integer as input, checks for factors from 1 to the number itself, and counts the factors. If the count is 2 (1 and the number itself), it prints 'Prime'; otherwise, it prints 'Not Prime'. The code is mostly correct but could be improved for better user experience and handling edge cases. Suggestions include adding input validation to handle non-integer inputs and negative numbers, and providing a more informative output.

Original Code

```
#include <stdio.h>

int main() {
    int n, count = 0;

    scanf("%d", &n);

    for (int i = 1; i <= n; i++) {
        if (n % i == 0)
            count++;
    }

    if (count == 2)
        printf("Prime");
    else
        printf("Not Prime");

    return 0;
}
```

AI Corrected Code

```
#include <stdio.h>

int main() {
    int n, count = 0;

    printf("Enter a positive integer: ");
    scanf("%d", &n);

    if (n <= 0) {
        printf("Please enter a positive integer.\n");
        return 1;
    }

    for (int i = 1; i <= n; i++) {
        if (n % i == 0)
```

```
        count++;
    }
    if (count == 2)
        printf("%d is Prime\n", n);
    else
        printf("%d is Not Prime\n", n);
    return 0;
}
```
